

The application is made with the help of “Express JS” and “HTTP” module provided by Node JS. The working is simple we are just taking input from user on the home screen. When the user press go button, then we use “body-parser” package to extract the country name from the form filled by the user. Then we simply call the API provided in the mail from iMarche and concatenate it with the desired country name.

The response that we get from the server is then saved as a string in a “names” variable and that string is modified as a HTML code. By using send method, we send the data to the user in the form of string which holds all the universities located in that particular country.
